Project Name	Emotion Detection & Learning Support Engine
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1: Realizing You're Stuck	Stage 2: Getting AI-Guided Support	Stage 3: Reviewing Progress
Actions What does the customer do?	- Encounters a confusing concept while studying - Tries re-reading the material or searching forums first - Opens the AI Learning Assistant Streamlit app	- Types a description of what they're stuck on - Clicks the "Get Guidance" button - Reads the detected emotion and the personalized guidance	- Applies the suggested strategy (e.g., rubber-duck debugging, a worked analogy) - Returns to the app with a follow-up question if still stuck - Checks the analytics dashboard to see their emotion trend
Touchpoint What part of the service do they interact with?	- Course materials / textbook - Study forums or classmates - Streamlit app home page	- Free-text input area "Get Guidance" button - Detected Emotion & Guidance result sections	- The personalized guidance paragraph - A repeat app session - The Plotly-based analytics dashboard
Customer Thought What is the customer thinking?	"I don't understand this at all." "Maybe someone else has explained this better." "Let me try this new tool."	"Will it actually understand what I'm feeling?" "That actually makes sense now." "That's a helpful next step to try."	"I feel more confident tackling this now." "I wonder if I'm making progress over time." "This dashboard shows I'm improving."
Customer Feeling What is	Confused and a little anxious	Hopeful, then relieved	Confident and motivated

the customer feeling?			
Process Ownership Who is in the lead on this?	• Student (self-directed)	• Emotion Detection module + AI Response Generator	• Student, supported by the Analytics Dashboard module
Opportunities How can we improve this stage?	• Proactively surface the tool when a student re-reads the same page repeatedly • Add a quick-start tooltip for first-time visitors • Reduce friction to open and start using the app	• Reduce response latency for guidance generation • Offer a follow-up clarifying question instead of a one-shot reply • Support voice input for hands-free use while studying	• Send a periodic summary of emotion trends to the student • Let students bookmark guidance messages that helped • Add light progress streaks to encourage consistent use
